

Using Windows Azure to
develop, secure and deploy
cloud applications

Microsoft

Agenda

Introduction to the Cloud OS

Windows Azure Overview

Visual Studio Tooling for Windows Azure

Scenarios:

- Dev/Test
- Web
- Mobile
- Hybrid

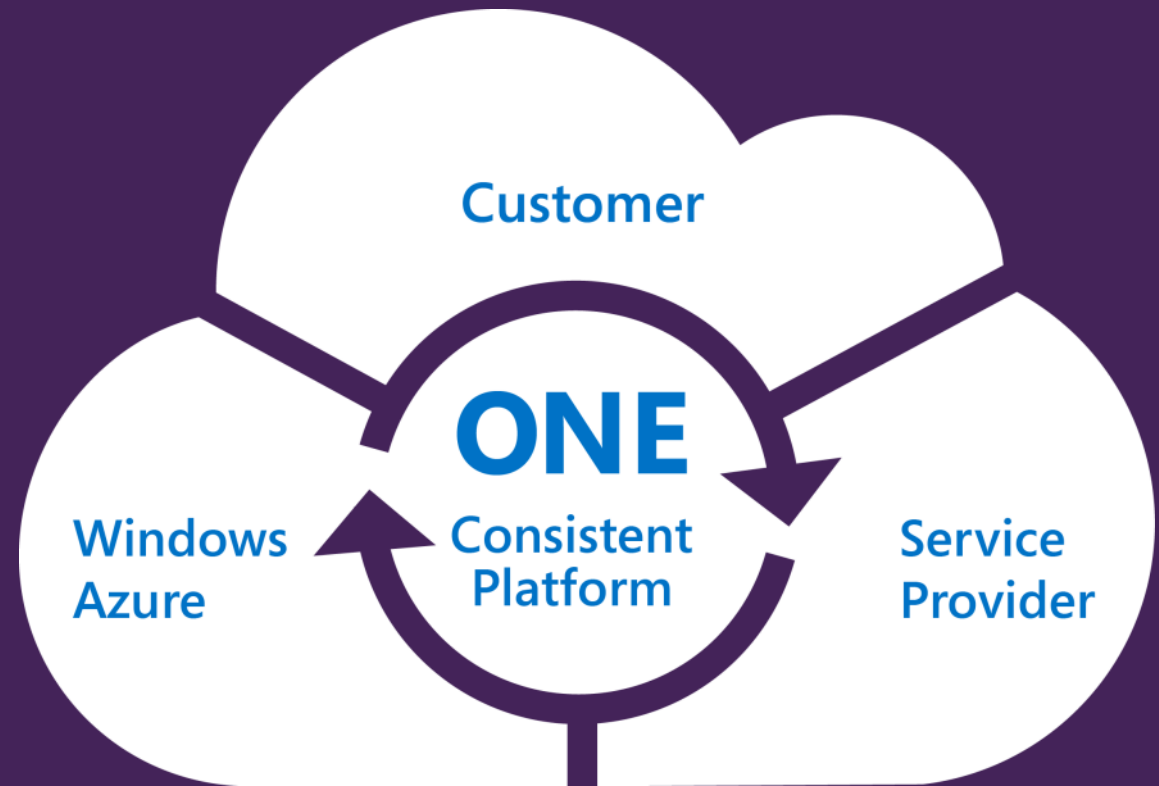

Cloud OS

Cloud OS Vision

Microsoft's vision of the unified platform for modern business

- transforms the datacenter
- unlocks insights on any data
- empowers people-centric IT
- enables modern business apps

consume

Why consider the Windows Azure cloud?

Time to
Market

Open and
Flexible

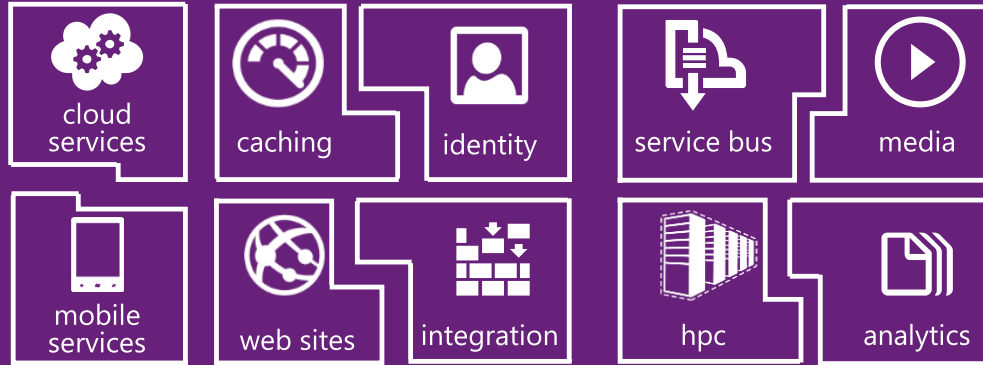

Economics

Windows Azure

app services

data services

infrastructure services

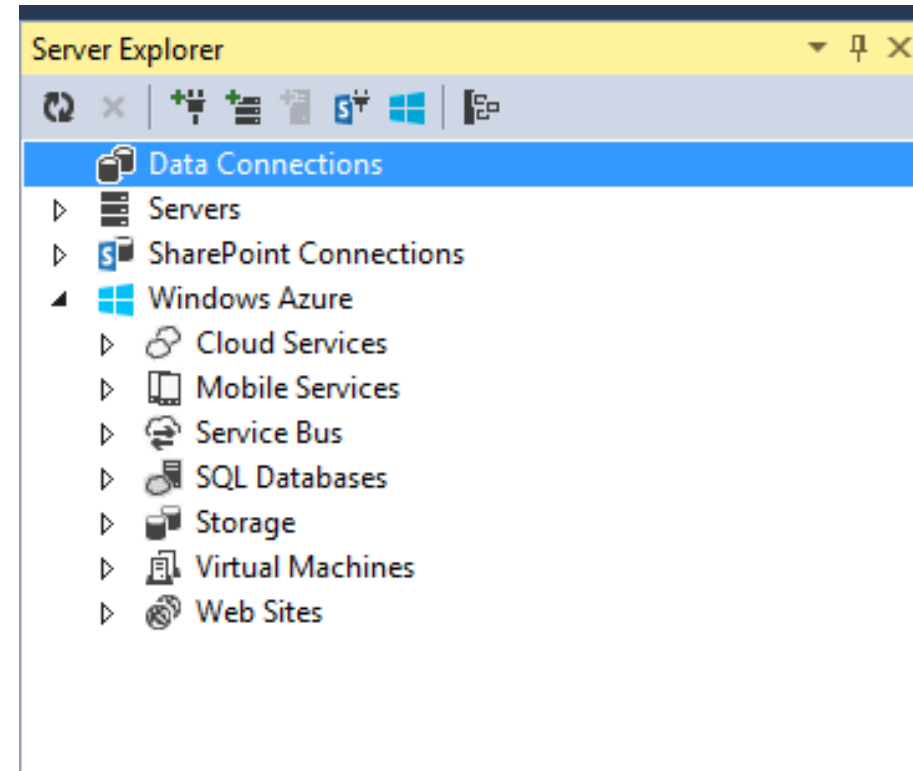

Visual Studio tooling for Windows Azure

Visual Studio Server Explorer

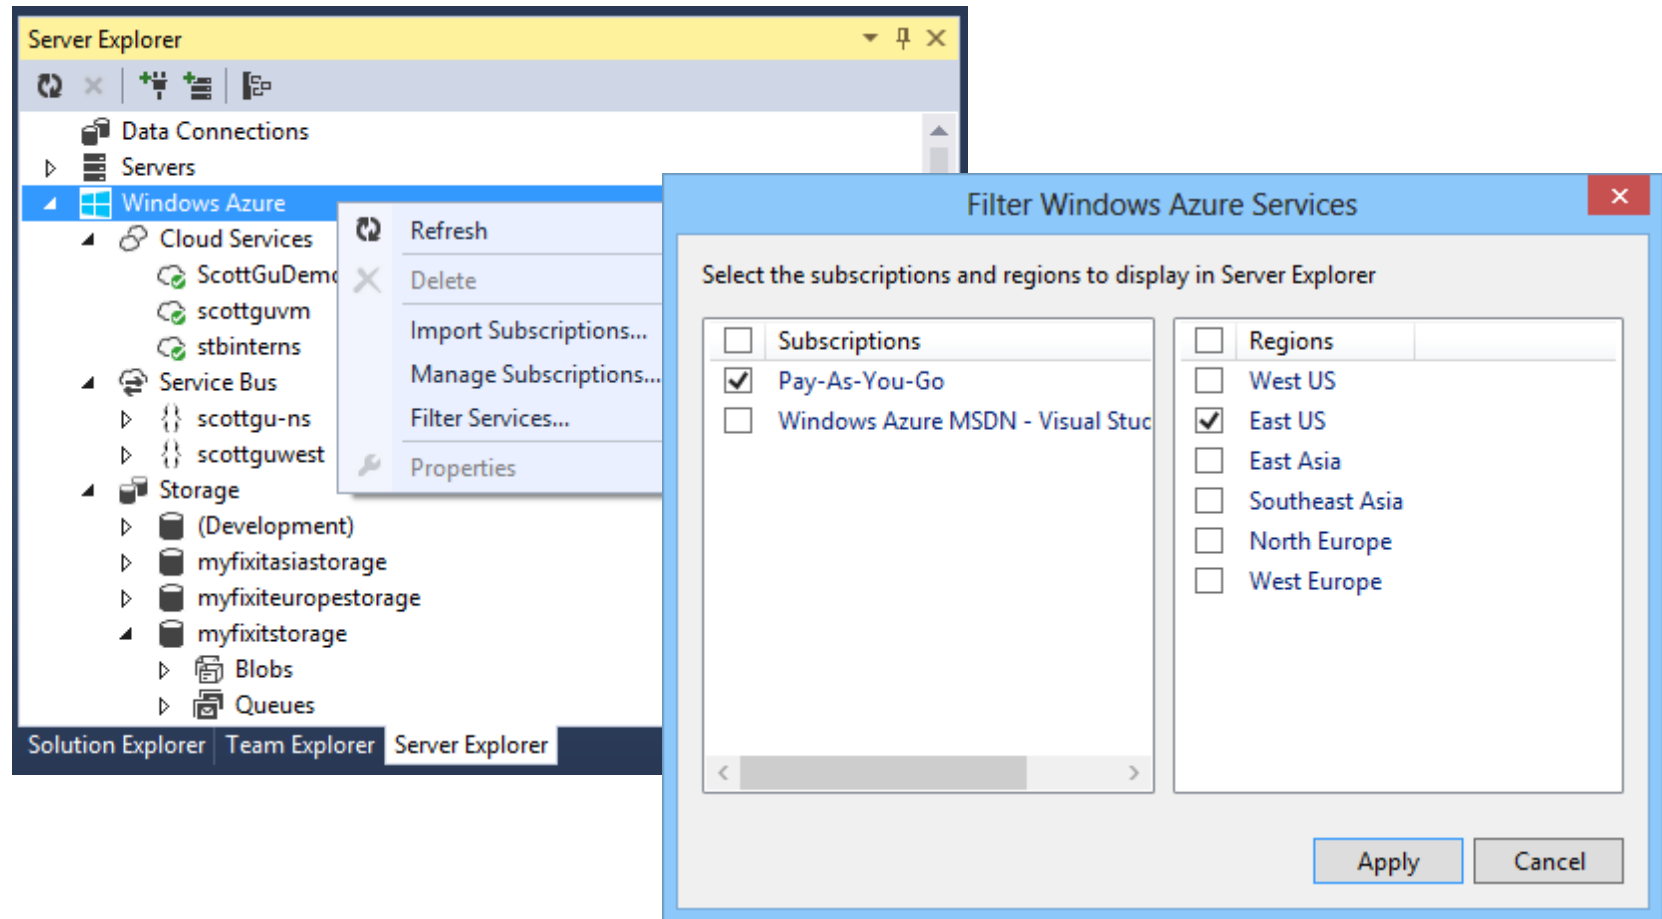

All services are now contained under a single Windows Azure node

VS OAuth with WLID

Visual Studio Server Explorer

Subscription and
Region Filtering
Support

Demo

Visual Studio tooling for
Windows
Azure

Dev/Test

Windows Azure for Dev/Test

Sandbox environments for application development and testing on supported OS

QA and application compatibility on new O/S (e.g., WS 2012) or software (e.g., SQL Server 2012)

Stress & load testing

SharePoint 2013 dev/test sandbox

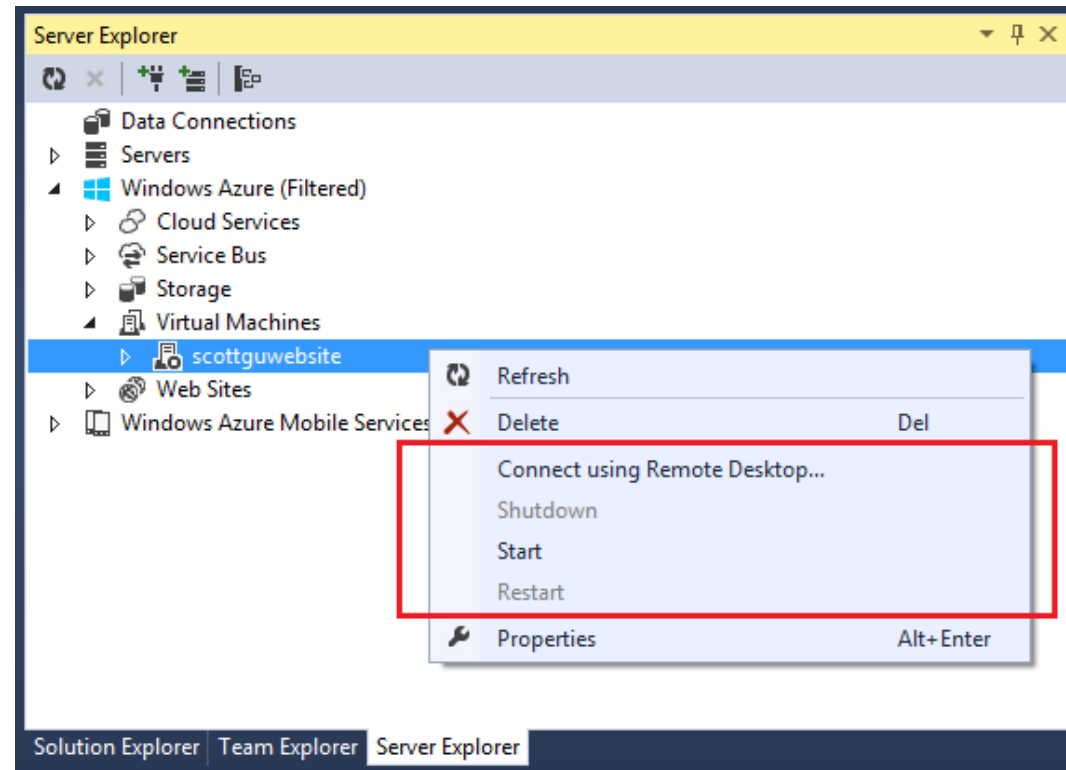

Reproduction and bug fixing for s/w and app stack failures

Environment for doing training, learning and application demos

TFS: Customized TFS setup with < 2200 users; testing TFS upgrades and roll-outs

Virtual Machines from Visual Studio

Stop/Start
Virtual Machines
within Visual
Studio

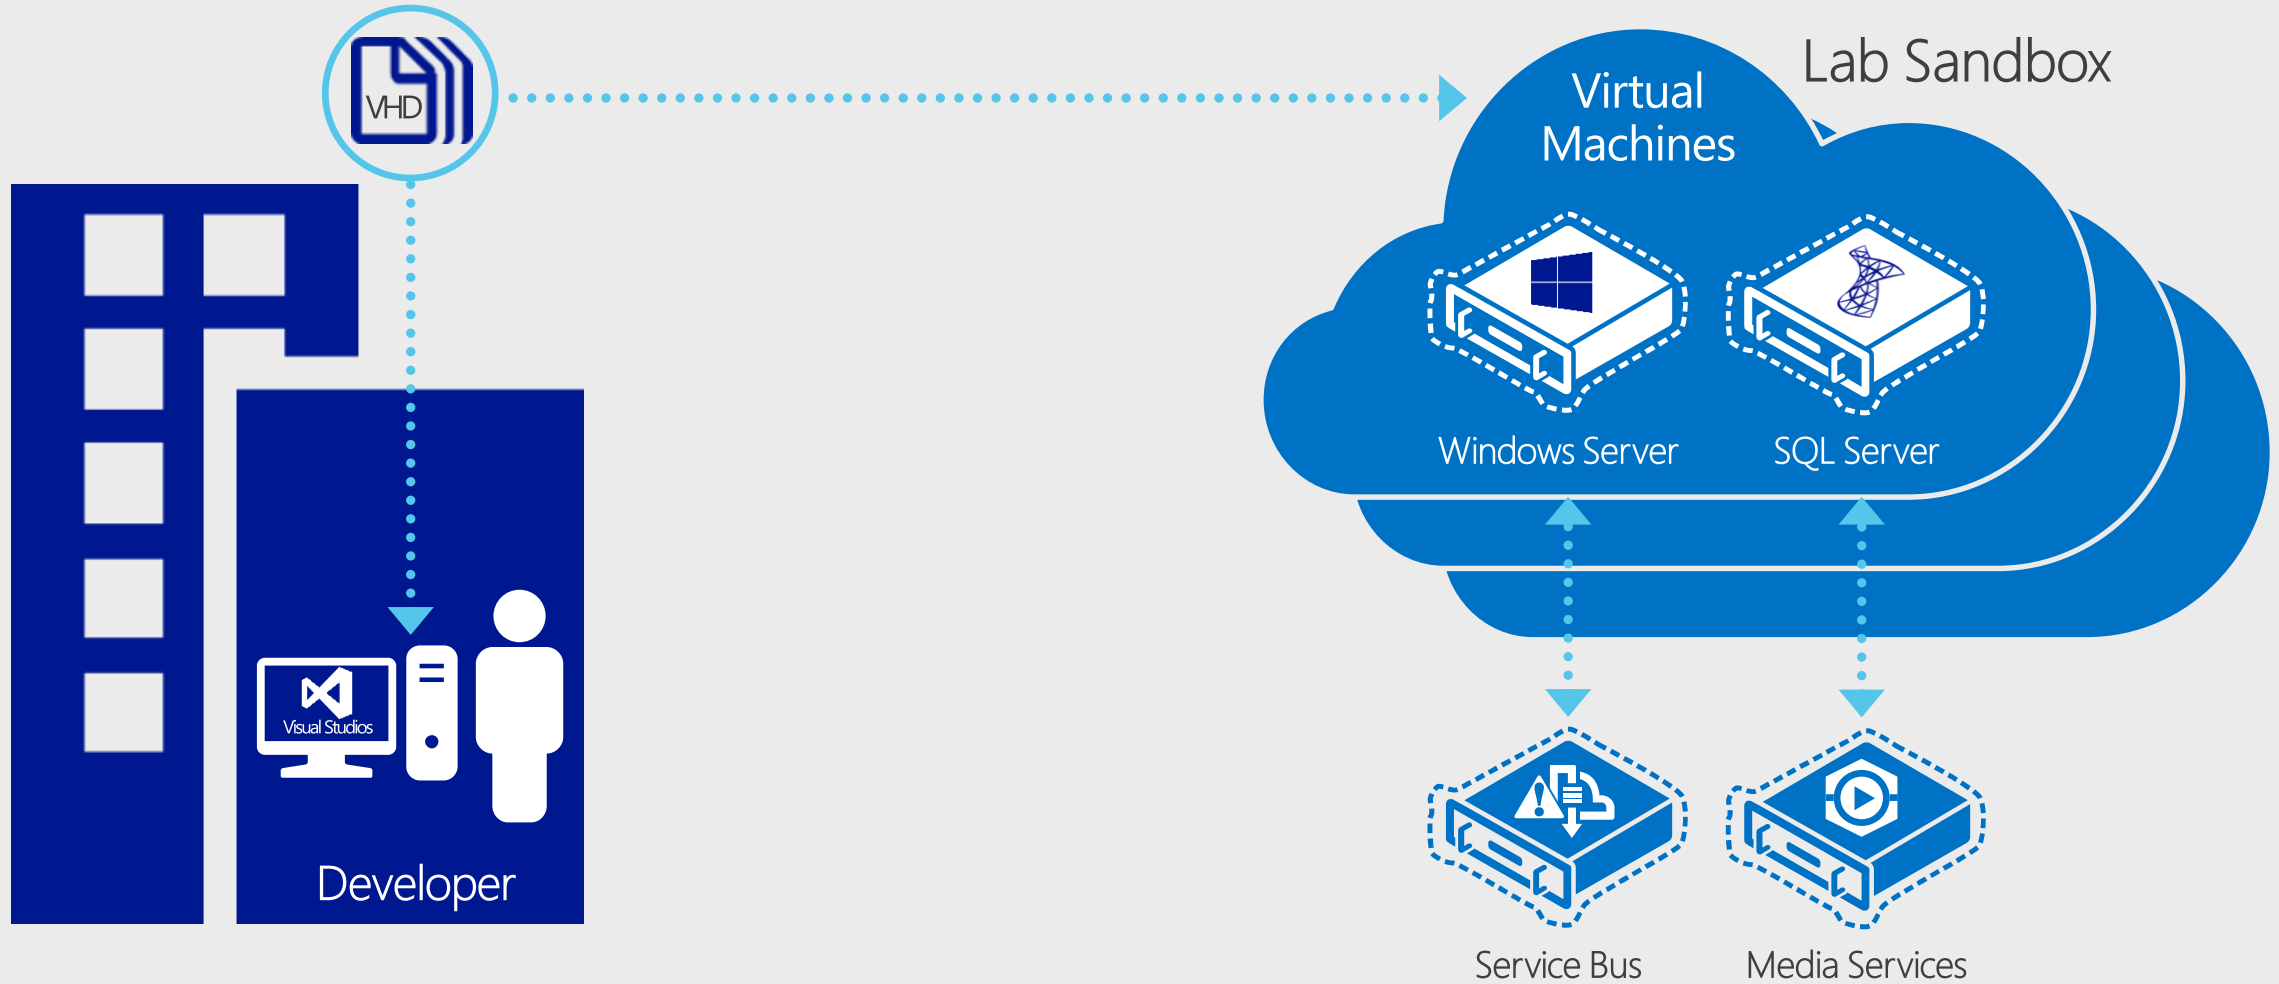

Dev/Test

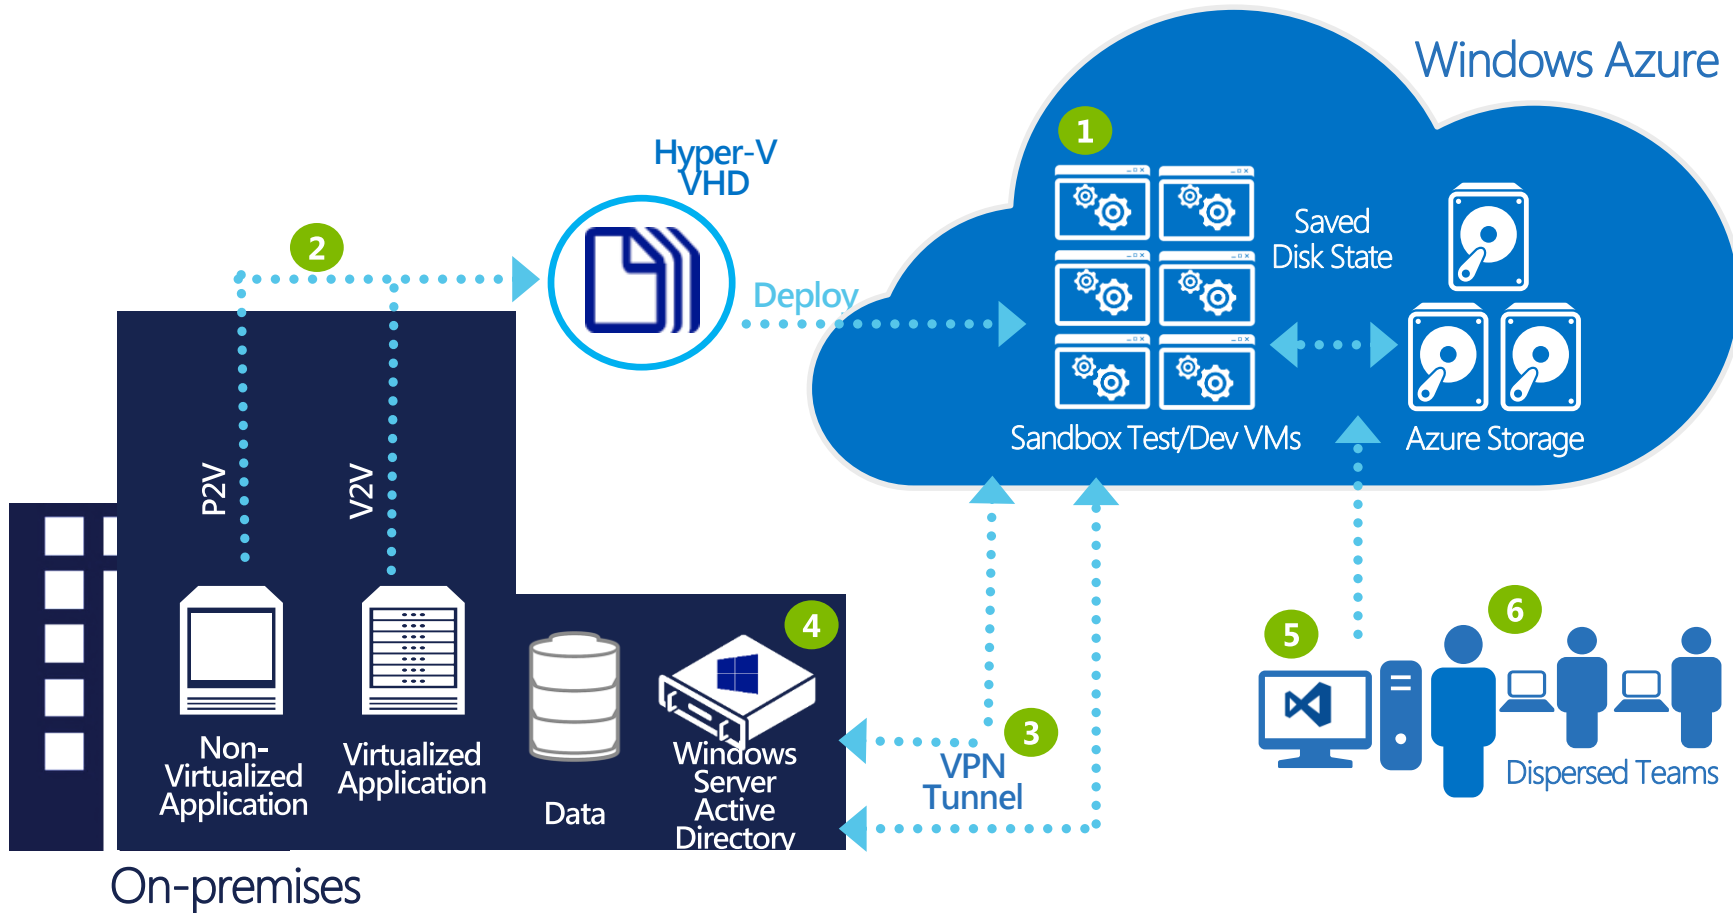

On-premises

Windows Azure

Dev/Test

- 1 Test/Dev VMs in the cloud
- 2 Leverage existing skillset to move test/dev to cloud
- 3 Connectivity with on-premises data and applications
- 4 Common identity
- 5 Common dev tools and frameworks for on-premise & cloud
- 6 Accessed by a geographically dispersed team

Demo

Spin up a dev/test
environment from Visual
Studio

Web

Web Sites

It's easy to deploy and administer high-density scalable website hosting services

Scalable

High-density and secure web hosting

Open publishing methods and protocols

Integrated and open solution

Automated

Lowers customer onboarding costs and streamlines upselling

Upsell from shared to reserved

Flexible

Support for PHP, Node.js, and ASP.NET

Metering and throttling of resources

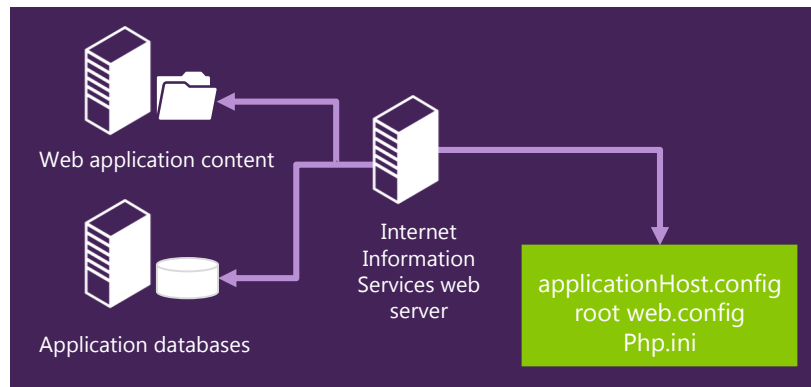

Fully integrated into Web App Gallery

Evolving from machine-centric to distributed model

Traditional machine-centric model

With multiple web applications, challenges for service providers include:

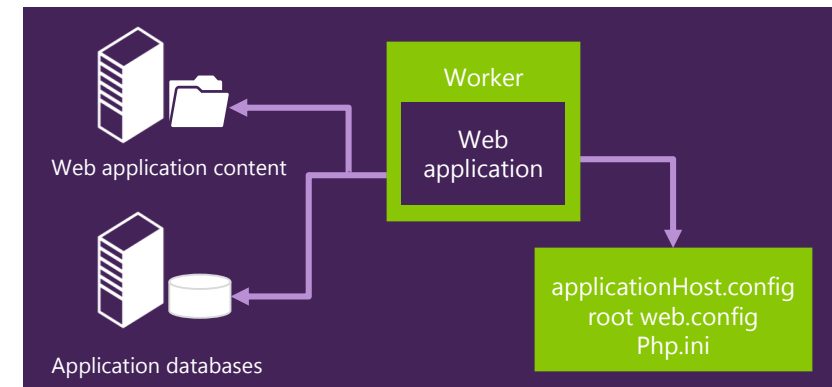

- Increased load and management complexities
- Security - Isolating stored data, authentication & authorization mechanisms
- Scaling - Auto-scaling platform compute, scaling platform storage
- Provisioning tenant resources
- Lack of support for multiple SSL web sites; applications have affinity to single servers

Distributed model

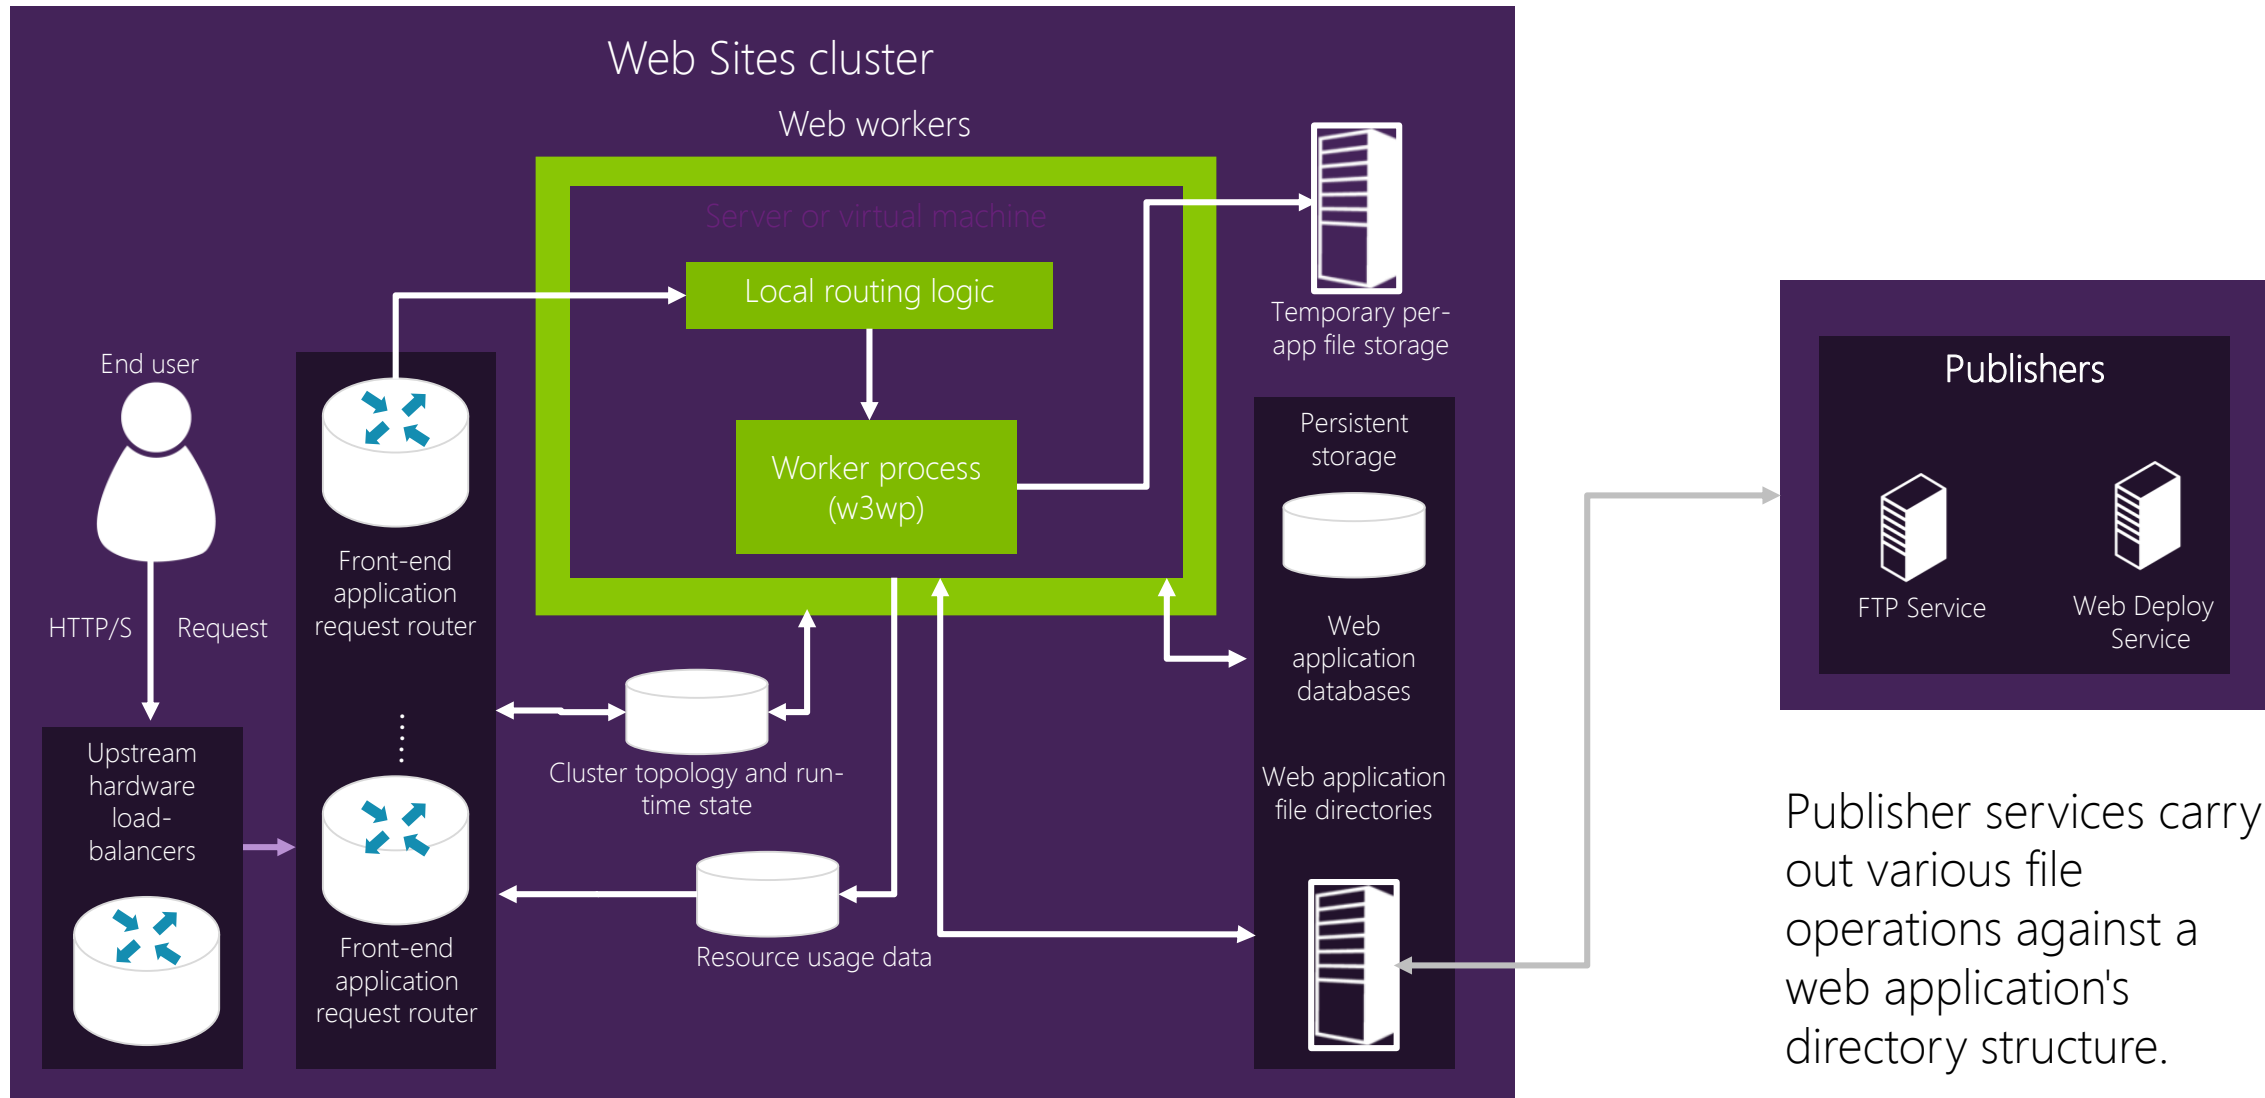

Web Sites allocates a web application to a specific process (or processes):

- Distributes load by allocating web applications to specific processes
- Enhances management by requiring no change to code for existing applications
- Provides a scalable and elastic resource pool capable of running an arbitrary set of web applications
- Provides multiple SSL Web sites that use unique server certificates for HTTPS binding; applications are freed from affinity to single servers

Publishing in Web Sites

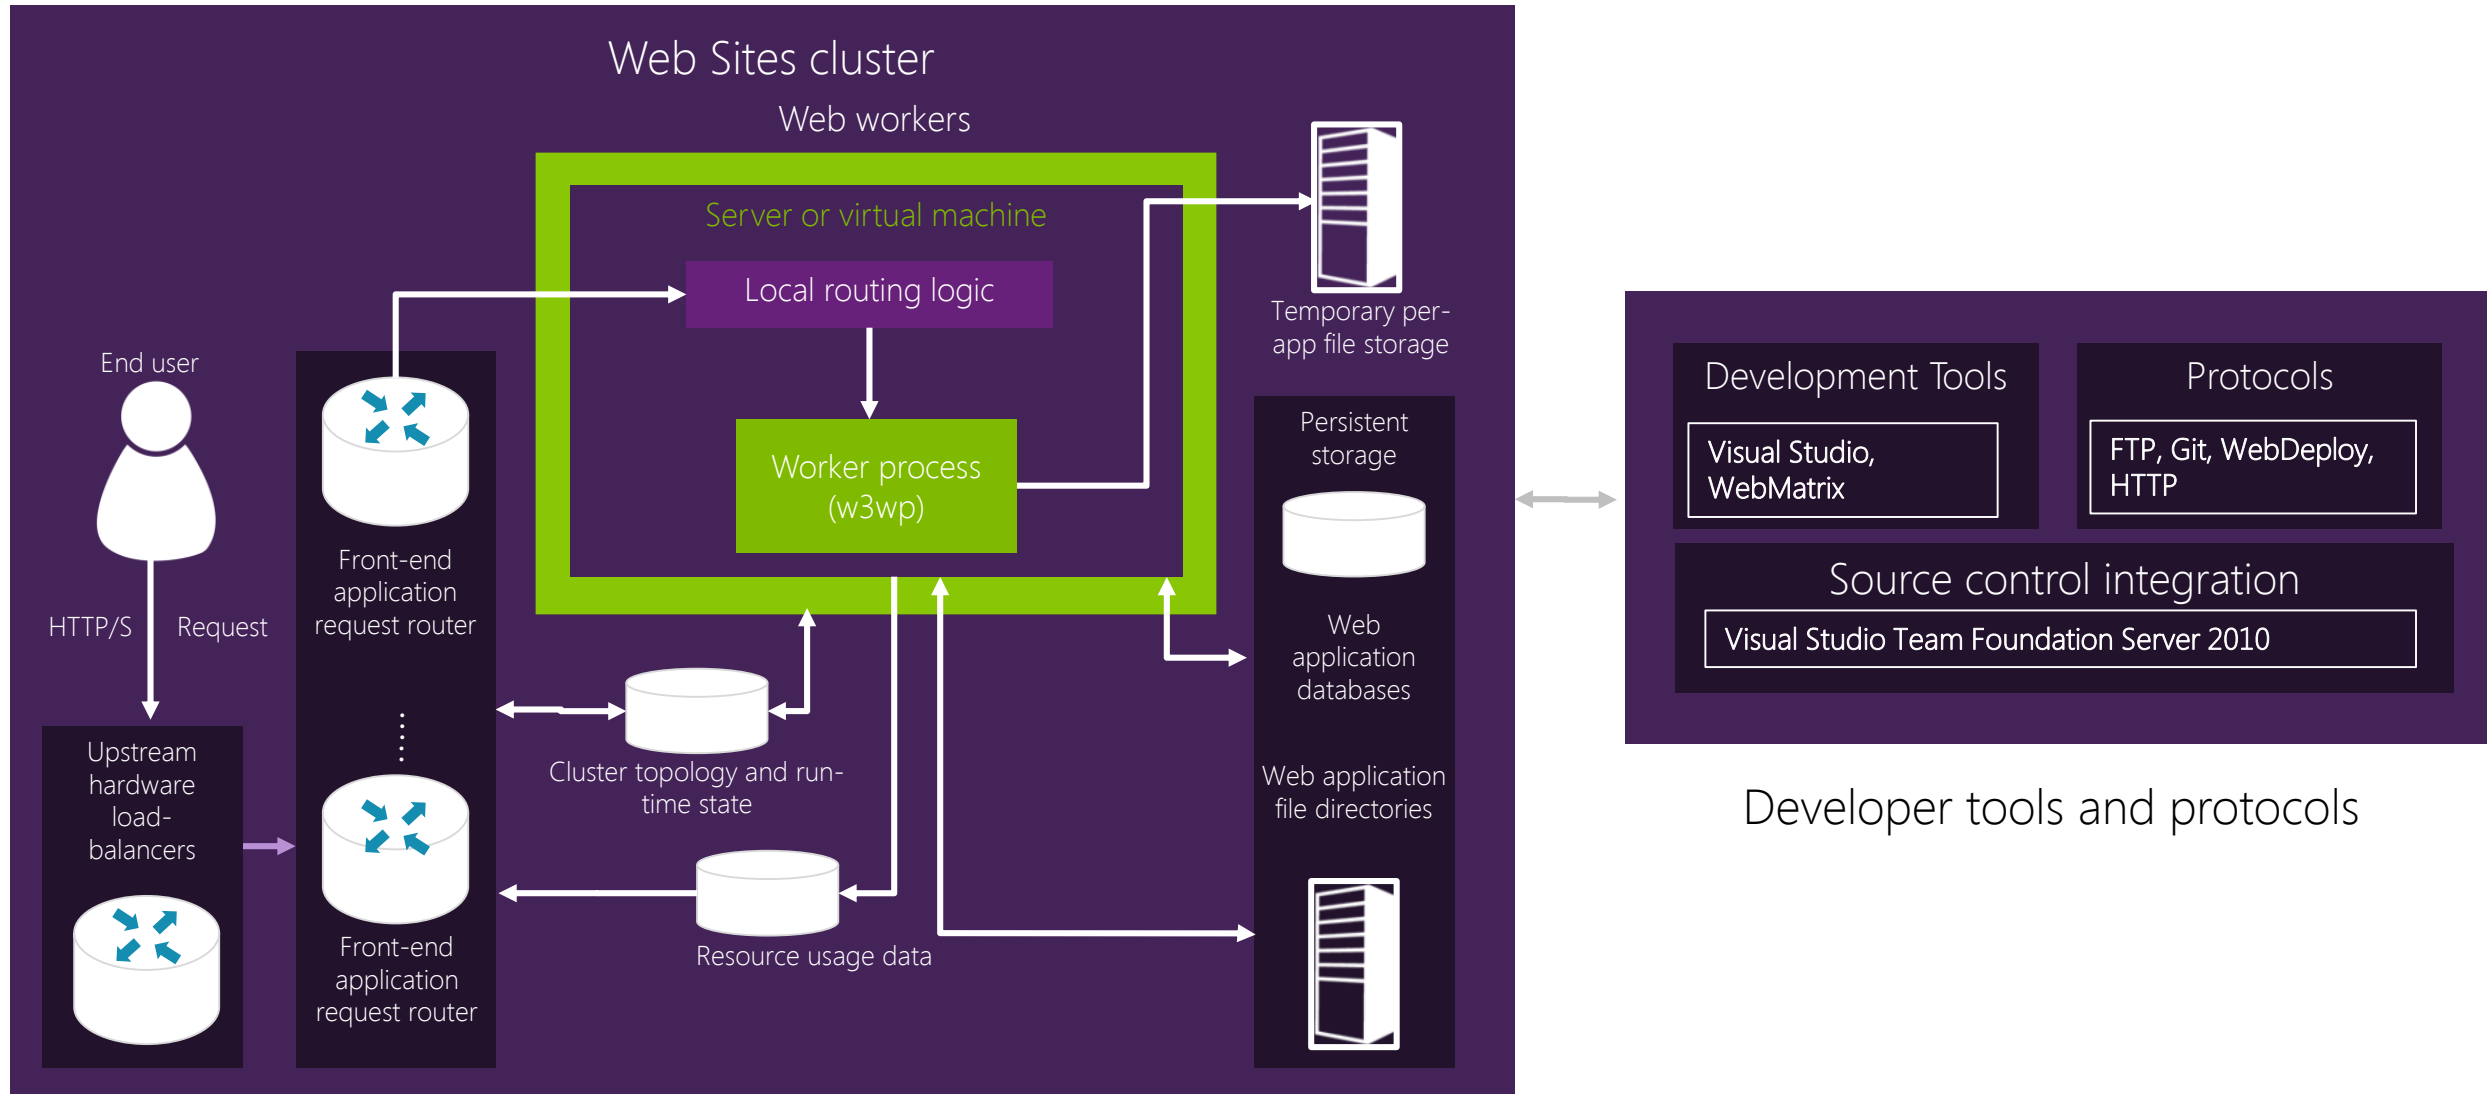

Using FTP and Web Deploy Services

Publisher services carry out various file operations against a web application's directory structure.

Development tools and protocols support

Decrease onboarding costs and increase customer satisfaction

Best Visual Studio experience

Move existing
ASP.NET
websites

Deploy and
manage in
Visual Studio

Studio

Mobile

Mobile Development with Windows Azure

Windows Azure provides two platform services that accelerate mobile development

Mobile Services and Notification Hubs

Mobile Services supplies a scalable and secure backend for mobile apps. With Mobile Services, it's easy to store data in the cloud, authenticate users, send push notifications, and add business logic.

Notification Hubs is a broadcast push service that makes it easy to send personalized push at scale with low latency from almost any app backend.

Mobile Services Overview

Windows Store
iOS
Android

Windows Phone 8
iOS
Android
HTML 5/JS

SDKs

REST API

Store Data in the Cloud

SQL

Table Storage

Blob Storage

Mongo DB

User Authentication

Facebook

Twitter

Microsoft

Google

Active Directory

Push Notifications

WNS & MPNS

APNS

GCM

Notification Hubs

Scripts:
table
scheduled
custom API

Source Control

Server-Side Code

Use server scripts to add custom logic to your mobile application as well as connect to other Windows Azure or third party services

Table

Tied to a CRUD operation on a SQL database

Ideal for actions triggered by events

JSON payloads only

Scripts can call other scripts and require user-submitted modules

Scheduled

Script runs on demand or on a user-defined schedule

Ideal for database cleanup, image resizing, periodic communications, etc.

Scripts can call other scripts and require user-submitted modules

Custom API

Scripts are not associated with a table

Ideal for most scenarios

Supports additional payloads like XML

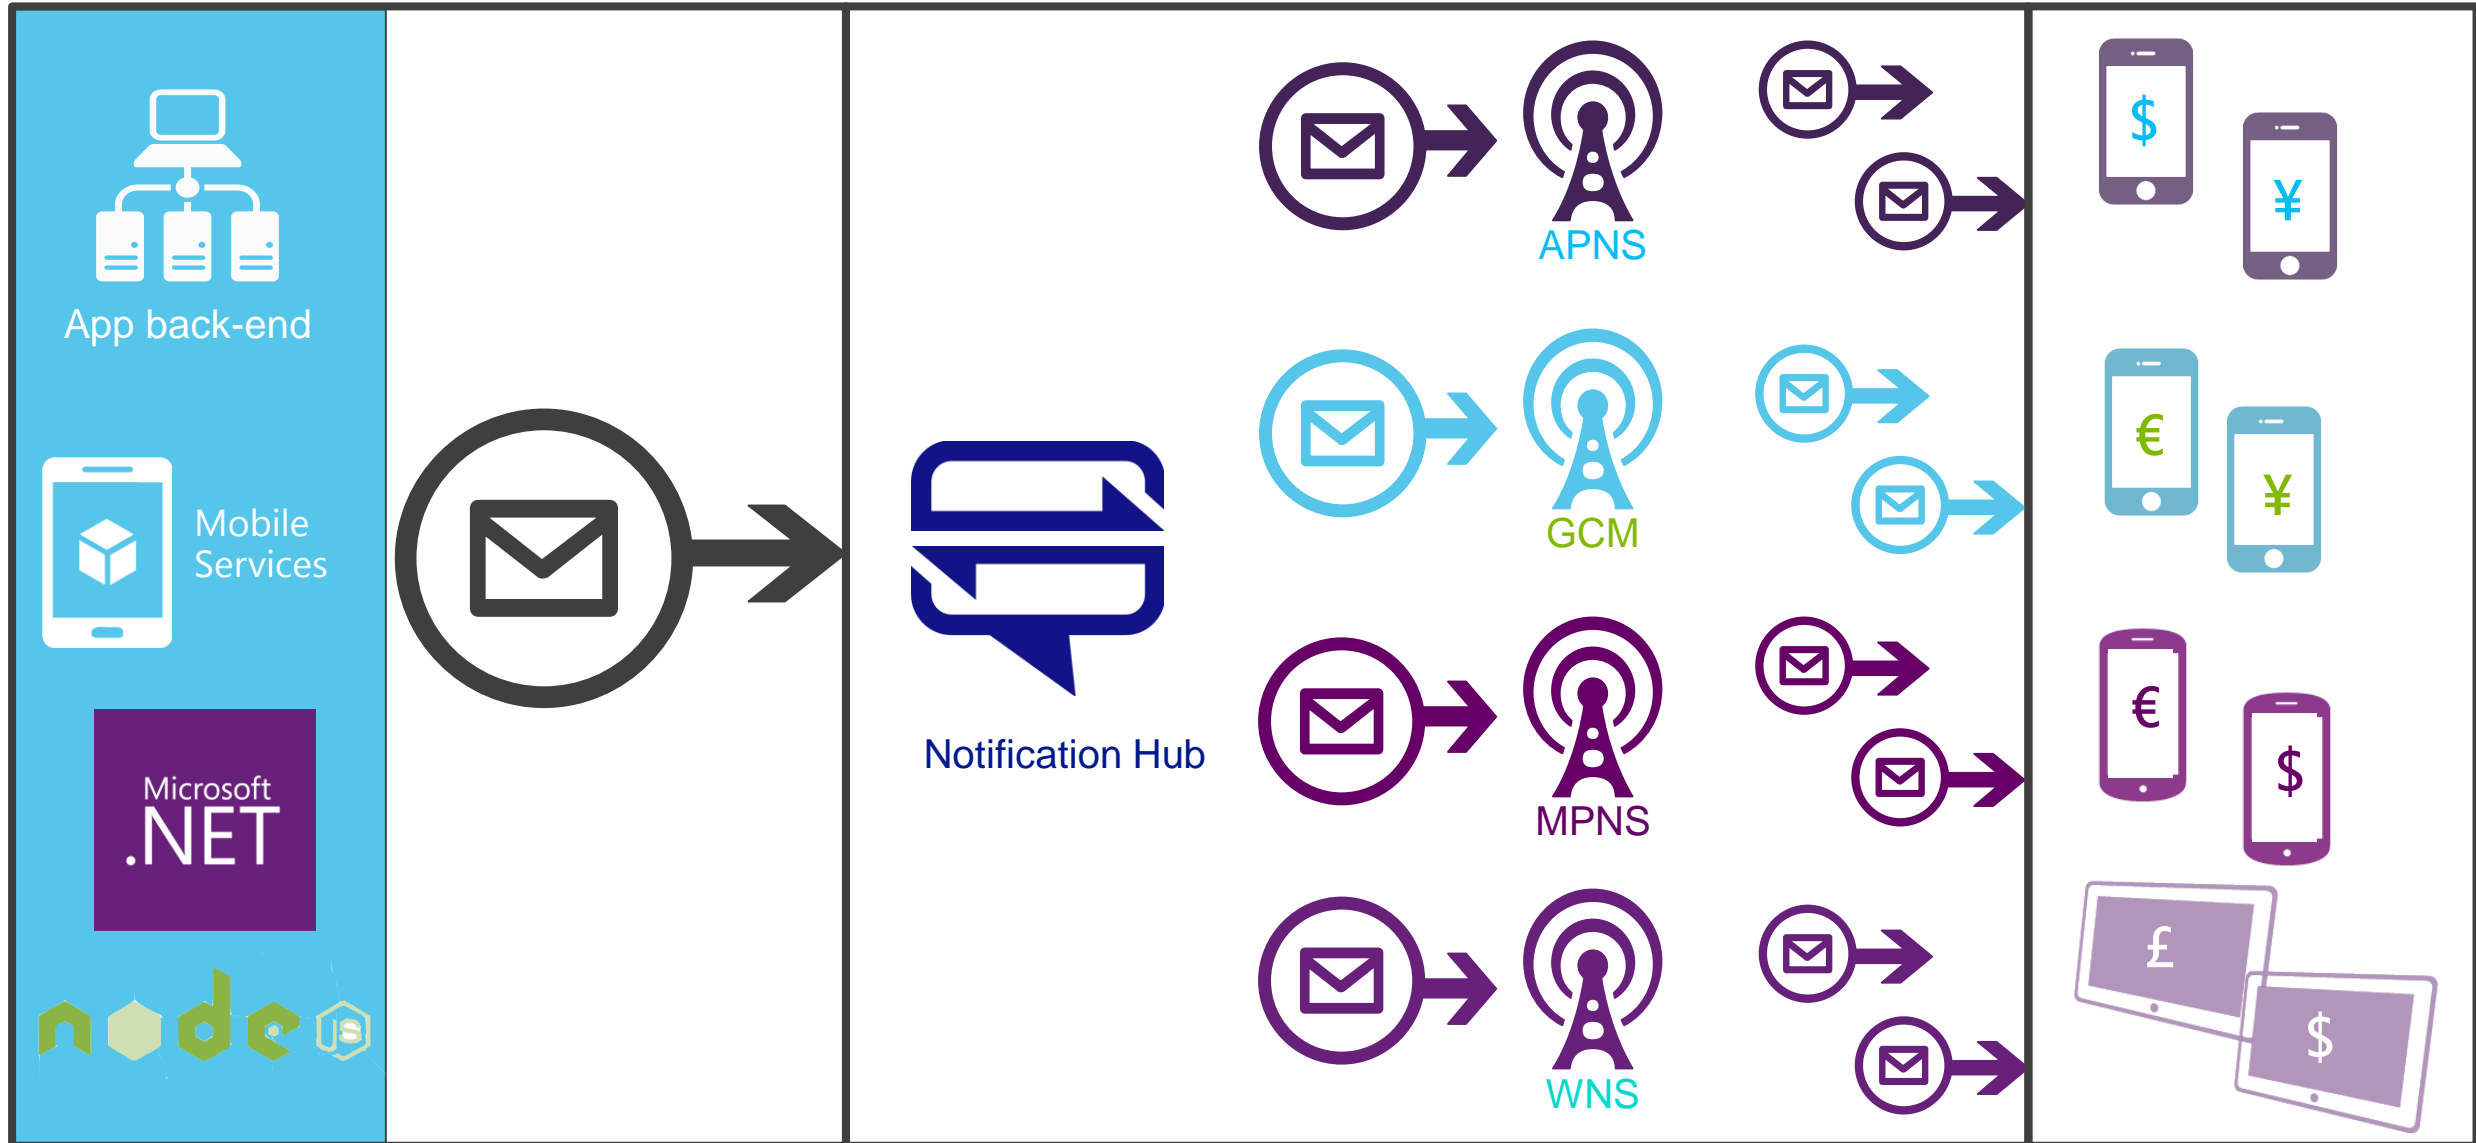

Scripts can call other scripts and require user-submitted modules

Demo

Mobile Services from
Visual Studio

Notification Hubs Overview

Platform protocols and storing device info

Without NH...

Each platform (Windows Store, iOS, Android) has a different push notification service

Different capabilities and protocols for each PNS

After opening communication channels, still have to store and update device info with platform specific protocols

Additional complexity for personalization based on interests, device, and format

With NH...

No platform specific protocols; backend communicates only with the NH

Avoid storing device information in the backend; NH maintains registry of devices and associated tags

Broadcast notifications to millions of devices across platforms with a single call rather than sending multiple messages based on platform, device, interests and preferences

Massive Scale, Low Latency

Without NH...

Spin up tens or hundreds of virtual machines in parallel

Shard your application

Route different subsets of registrations to various VMs

Backend sends millions of notifications to account for different platforms, interests, formats, app versions, etc.

With NH...

Specify a set of tagged registrations (or no tags to reach all registered devices)

Specify a message and a payload

Send one message to the NH

NH automatically routes the message to the millions of designated registrations within minutes.

NH cleans up device registry to reflect uninstalls

Notification Hubs Overview

Registering New Devices with your Notification Hub

1

User downloads app from public or private app store.

Notification Hub

2

Notification Hub associates:

- interest tags (e.g. male, photography, Seattle)
- format template (e.g. Spanish, Euro, Celsius)

with each registration

3

Installed app, NH maintains:

- tags
- template

User Management

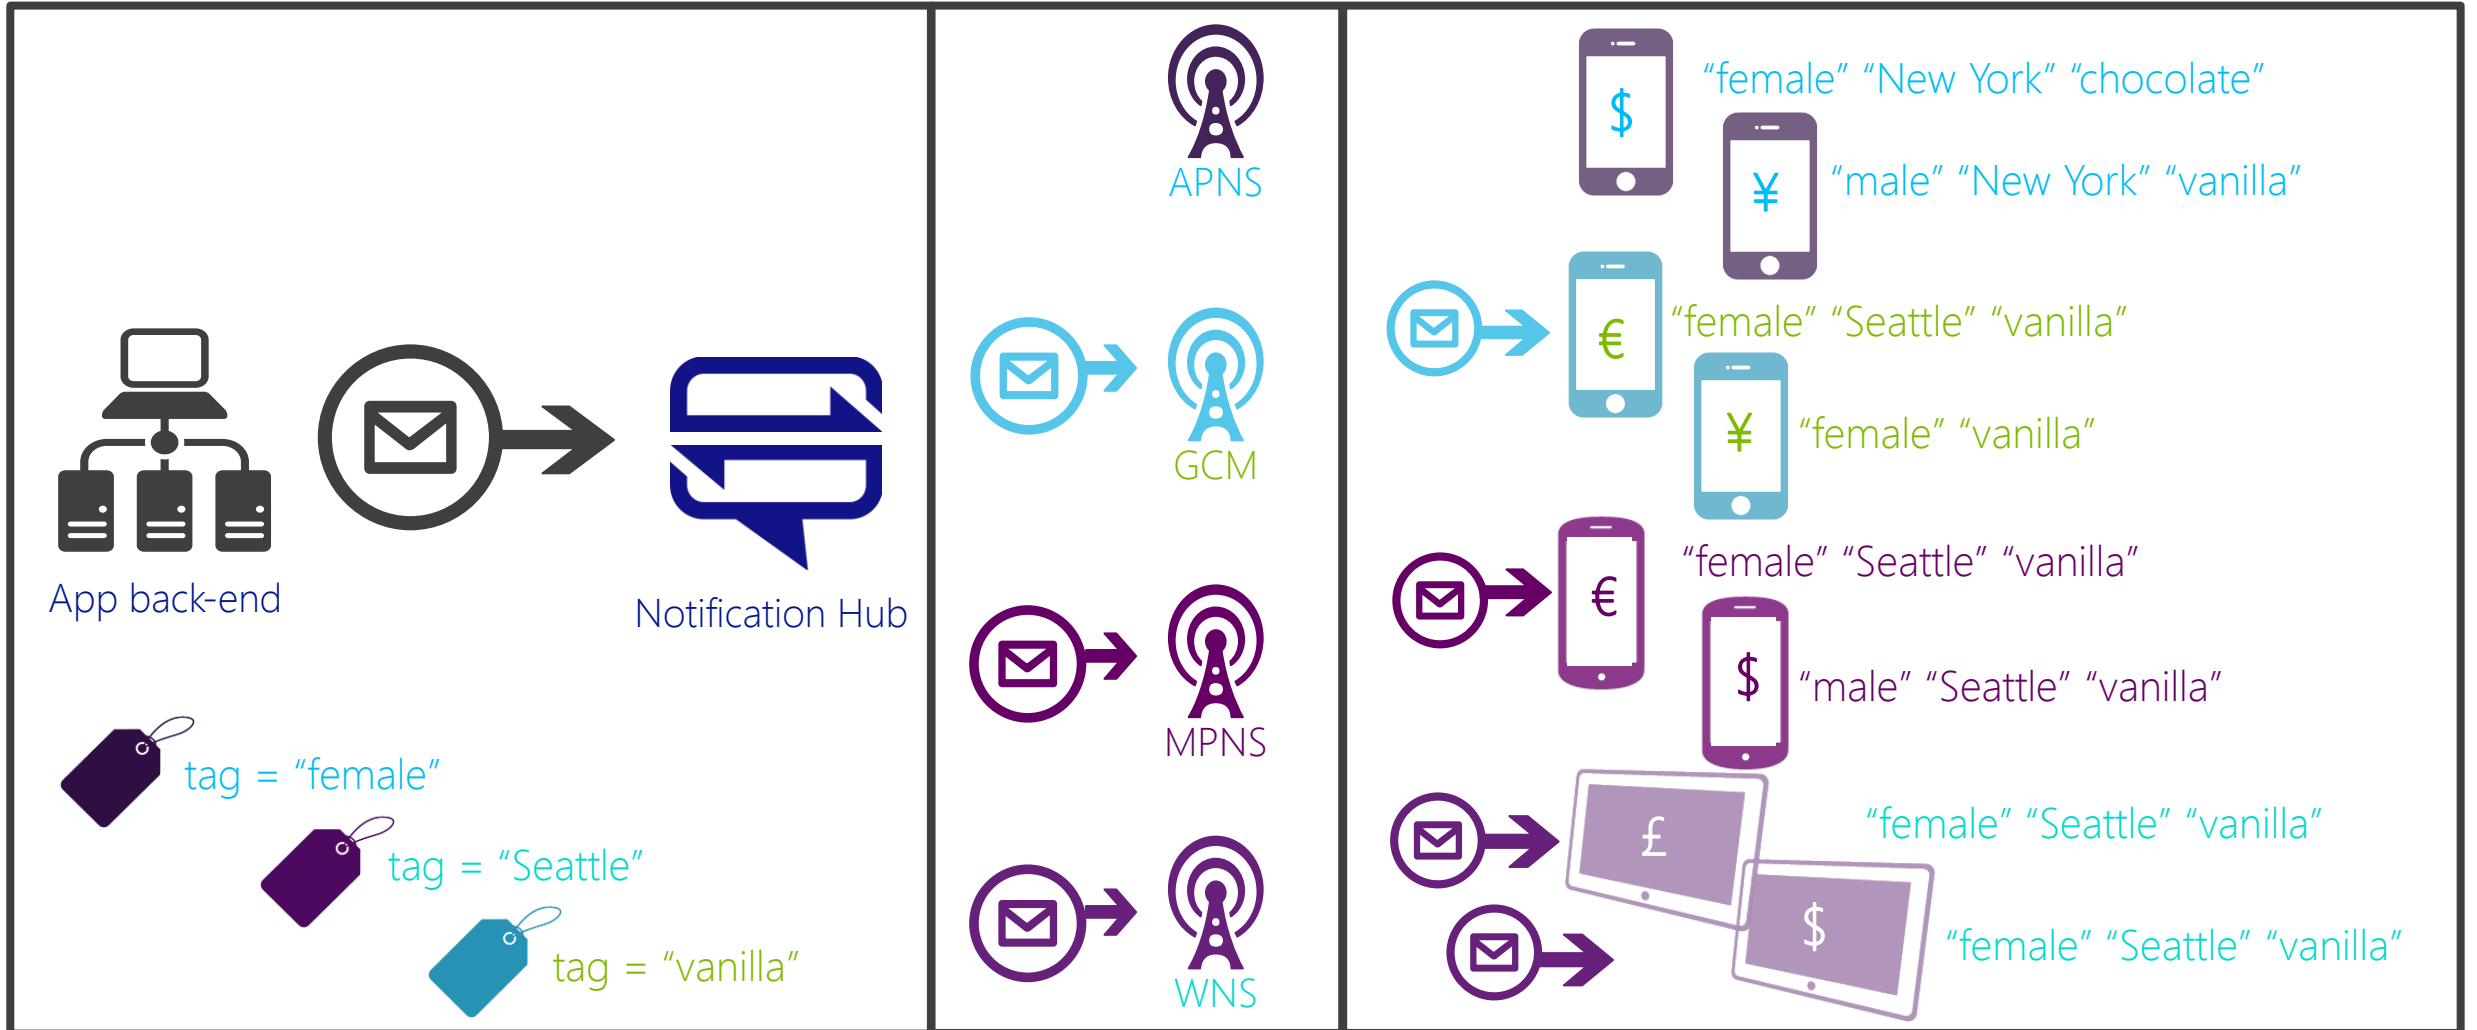

Uninstalled app, NH:

- purges the registration
- stops sending messages

Notification Hubs Overview

Sending a Cross-Platform Push Notification based on tags

Notification Hubs Overview

Template is applied on the client as users receive the message

Demo

Push Notification from
Visual Studio

Hybrid

Investments in Hybrid

Core technologies that enable a truly hybrid application platform

CLOUD

ON PREM

Data Synchronization
SQL Data Sync

Application-Layer
Services/Messaging & Identity
Service Bus & Windows Azure Active Directory

Secure Site-to-Machine Connectivity
Virtual Network Point-to-Site VPN

Secure Site-to-Site
Network Connectivity
Virtual Network Site-to-Site VPN

Windows Azure Service Bus

Service Bus Relay

Scenario: You have on-premise systems that you need to communicate with directly from outside your organization...

Solution: Internal Web Services are exposed securely via the Relay which passes calls into the on-premise service and back to the calling clients

Relay: Two Way Call into On-Premise Service

Service Bus Queues

Scenario: Multiple systems and remote clients need to send business events to head office which processes these messages under varying load.

Solution: Queues decouple senders from receivers, multiple receivers can handle varying load, simple to add new senders without impact.

Message Queue: FIFO Resilient Queue

Service Bus Topics

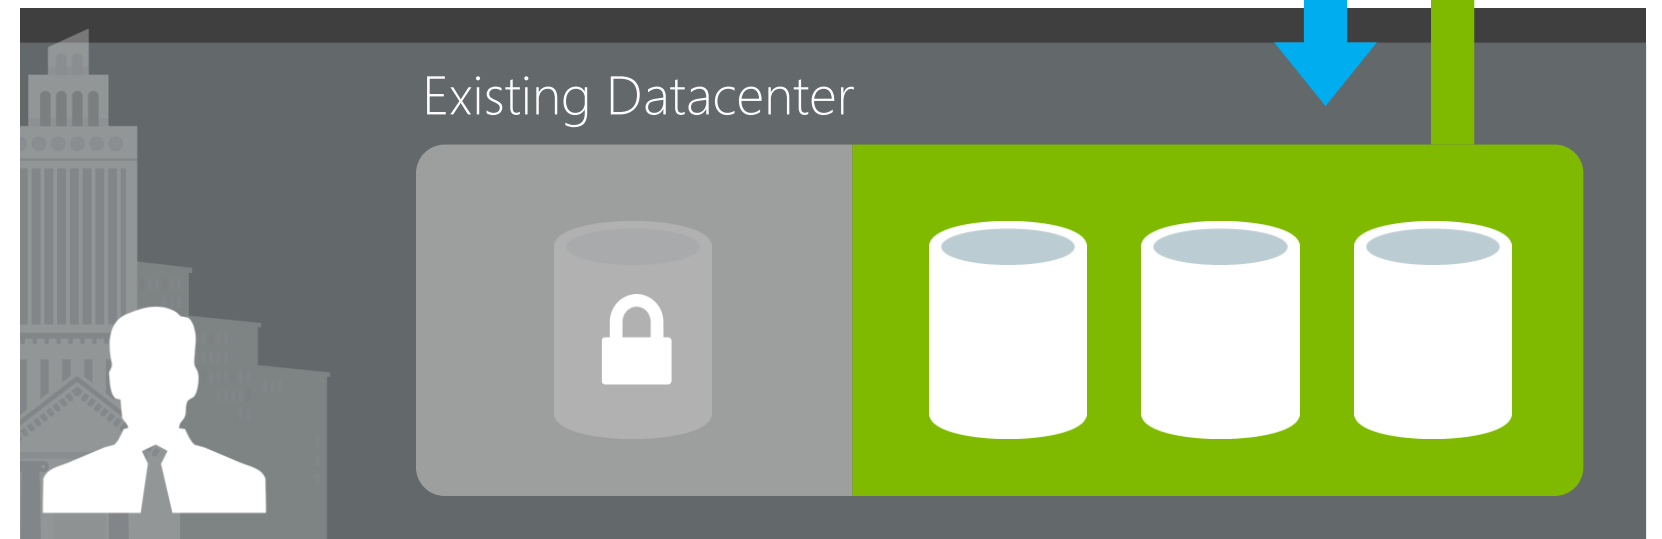

Scenario: Multiple actions have to be taken as a result of incoming messages from external systems but these actions frequently change.

Solution: Topics are special queues that have subscriptions which contain rules to determine which messages a subscription will contain.

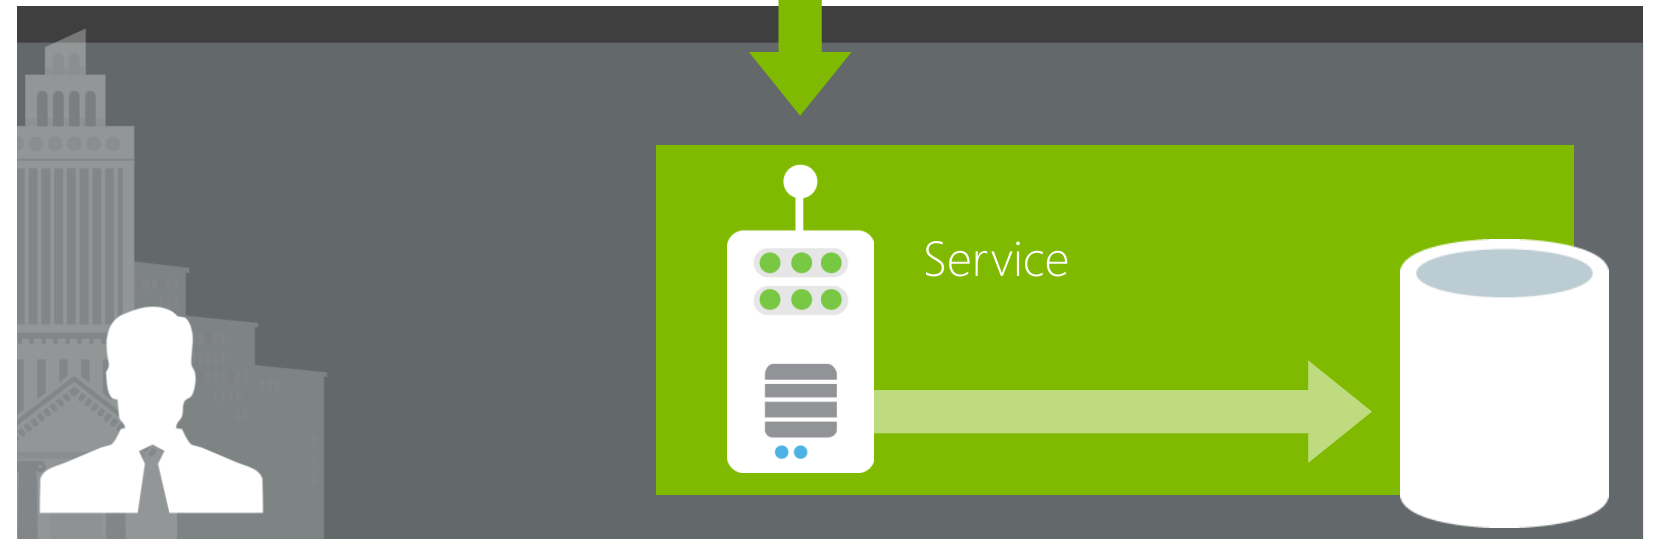

Topic: Queue with 1:n rule based subscriptions

Service Bus Relay

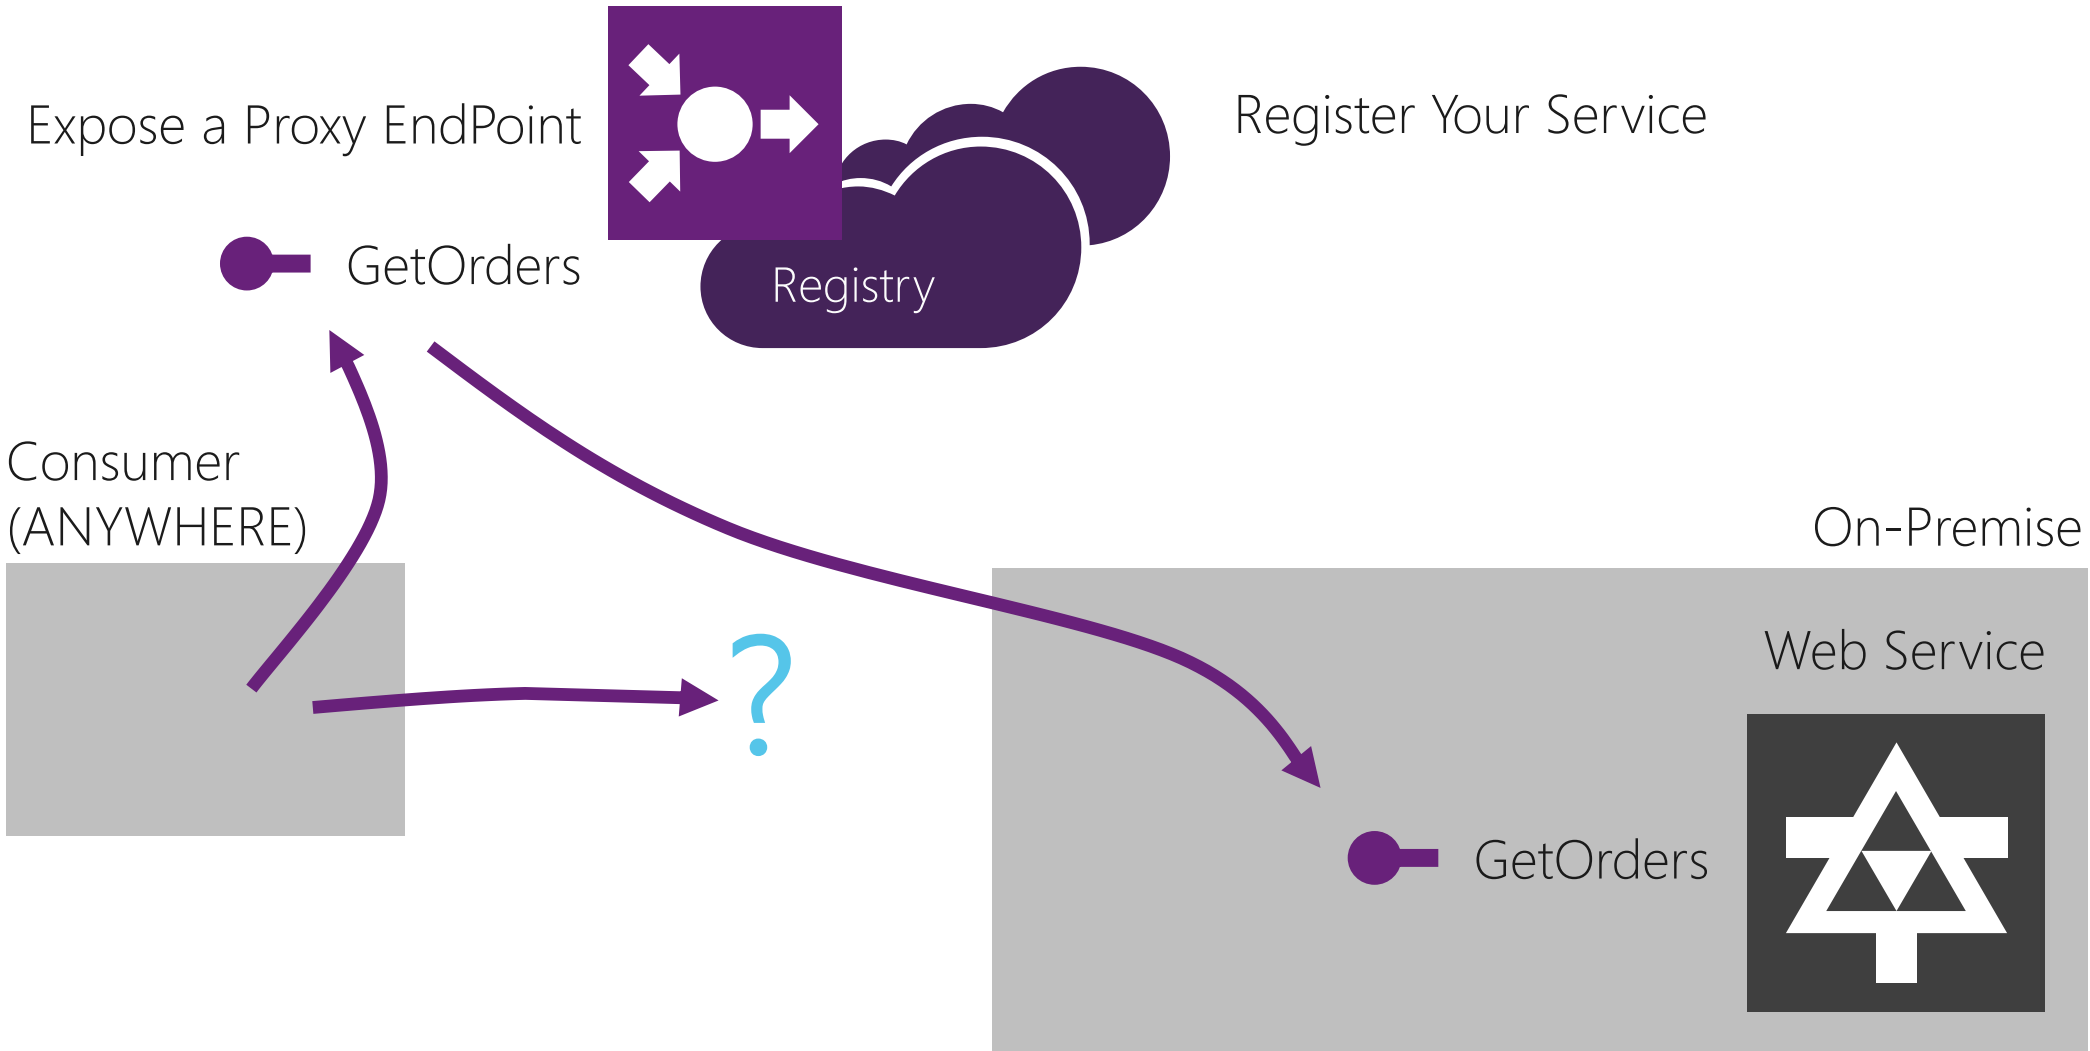

On Premises

On Premises

Service Bus Relay

Windows Azure Active Directory

Office365 services needed access to customer directories to provide best-in-breed experiences

Offer identity services to Organizations without on-premises directories

Run at internet scale

Offer multi-tenancy

Internet-scale multi-tenant directory

Build concurrently with Office 365

Extends Windows Server Active Directory into cloud

Cloud-based directory and identity services

Protocols to connect with Azure AD

	Purpose	Details
REST/HTTP directory access	Create, Read, Update, Delete directory objects and relationships	Compatible with OData V3 Authenticate with OAuth 2.0
OAuth 2.0	Service to service authentication Delegated access	JWT token format
SAML 2.0	Web application authentication	SAML 2.0 token format Used with Office 365 Services
WS-Federation 1.3	Web application authentication	SAML 1.1 token format Used with Office 365 Services

Demo
